business OVERVIEW

Teleran Technologies is a provider of patented, expert system-based software that audits, secures, and manages the use of conventional enterprise and cloud applications including business intelligence, data warehouse, ERP and CRM. Teleran's network-based solution provides a centralized and automated management layer that tracks and controls usage at the user, application, and database level.

products & SERVICES

iSight™ - continuously audits, analyzes and reports on application usage for regulatory and security policy compliance, data misuse, intrusion detection, user management and performance tracking.

iSight Analytics™ - is a series of ready-to-go analytic application modules that deliver comprehensive visibility and insight for compliance and security, and performance management. It transforms the metrics captured by iSight into actionable information leveraging the latest business intelligence technology for visualization, dashboarding, reporting and analysis.

iGuard™ - protects enterprise application and data assets with its patented policy action engine by automatically preventing inappropriate, unauthorized or long-running reports /queries before they hit the database and breach data security and governance policies, degrade application performance, or return incorrect answers.

iGuard Alert™ - automatically warns authorized and unauthorized users attempting to gain access inappropriately, and alerts security support staff to attempted policy breaches. Based on a patented expert system, iGuard Alert messages can also guide application users to more effectively and efficiently access and interact with applications and data.

Teleran's products operate on the network, independent of applications and databases. They require no changes to application environments and provide a highly scalable foundation for enterprise-wide audit and usage control facilities.

Teleran's low cost "drop-in" product architecture enables the company's solutions to install quickly with no performance degradation to applications and minimal maintenance requirements. Unlike database or system monitors, Teleran's products require no "in the database" agents, traces or monitors that impede performance and increase administrative overhead.

teleran POSITIONING

Teleran's product suite combines continuous auditing and patented real-time policy enforcement that delivers security audit and enforcement, regulatory and corporate governance policy compliance, and real-time application management solutions. Teleran's products operate independently of applications and databases and provide comprehensive, consistent auditing and controls across both enterprise applications and corporate databases.
